

Chintu ka “Travel Agency” Example

Chintu ek **travel agency** chalata hai aur ab apna IT system manage karna chahta hai.

1. On-Premises (Traditional IT)

Chintu ne decide ki wo **sab kuch khud manage karega** – servers, website, booking system, database, aur security sab office me khud rakhega. Agar server down ho gaya ya booking system crash ho gaya, toh Chintu ko hi solve karna padega.

2. IaaS (Infrastructure as a Service)

Chintu socha, “Server aur storage khud manage karna mushkil hai.”

Toh usne **cloud servers rent kiye** – virtual machines aur storage cloud provider deta hai, par booking software aur database ka setup Chintu ko khud manage karna hai.

Matlab: **infrastructure cloud ka, application aur data Chintu ka.**

3. PaaS (Platform as a Service)

Chintu ne socha, “Mujhe sirf booking app develop karna hai, servers aur database ka tension nahi chahiye.”

Cloud provider **ready-made development platform** deta hai – database, OS, runtime sab ready hai. Chintu bas apna booking application aur data manage karta hai.

4. SaaS (Software as a Service)

Chintu socha, “Mujhe development ka bhi tension nahi chahiye, bas bookings manage karni hai.”

Toh usne **ready-made travel booking software** use kiya – sab ready hai, Chintu bas trips add karta hai aur bookings manage karta hai. Cloud provider sab handle karta hai.

Ek line me summary:

On-Premises:* “Sab kuch khud manage karo, full control.”

IaaS:* “Servers cloud ke, application aur data aap manage karo.”

PaaS:* “Platform ready hai, bas app aur data manage karo.”

SaaS:* “Sab ready hai, bas software use karo.”
