

Traditional IT (On-Premises) Problems

Hardware kharidna padta tha – Server, Storage, Network devices khud kharidne padte the.

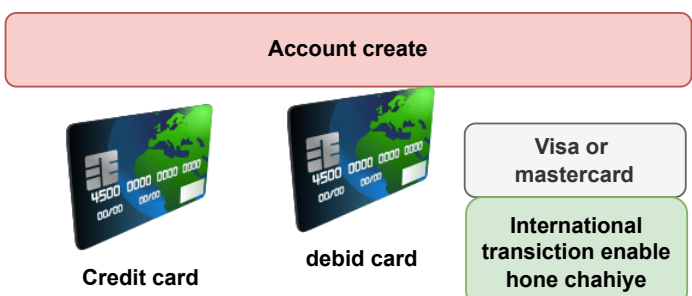

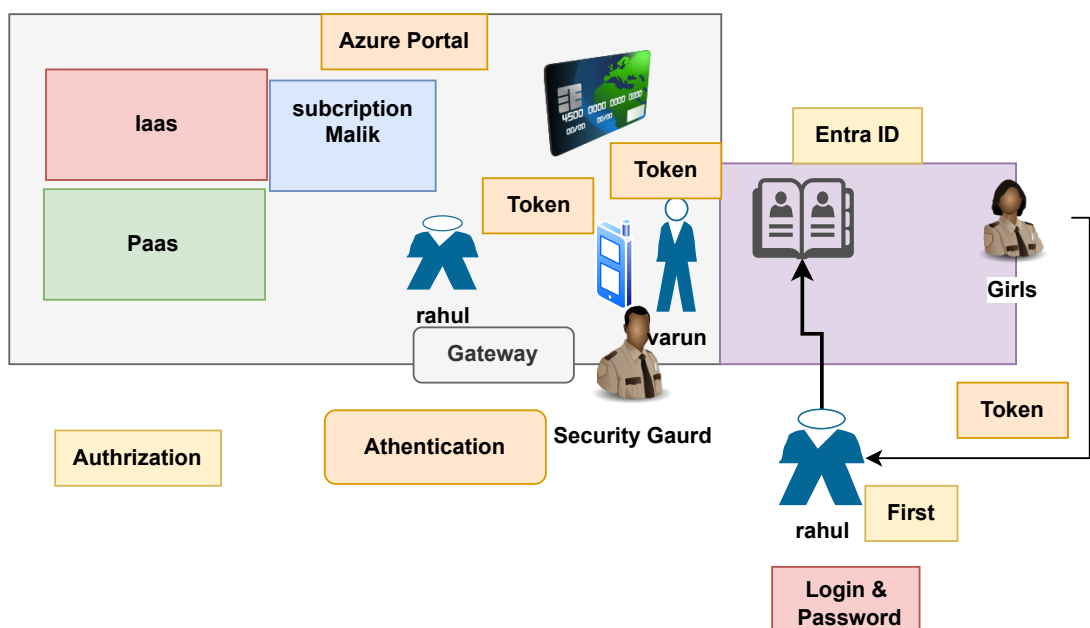

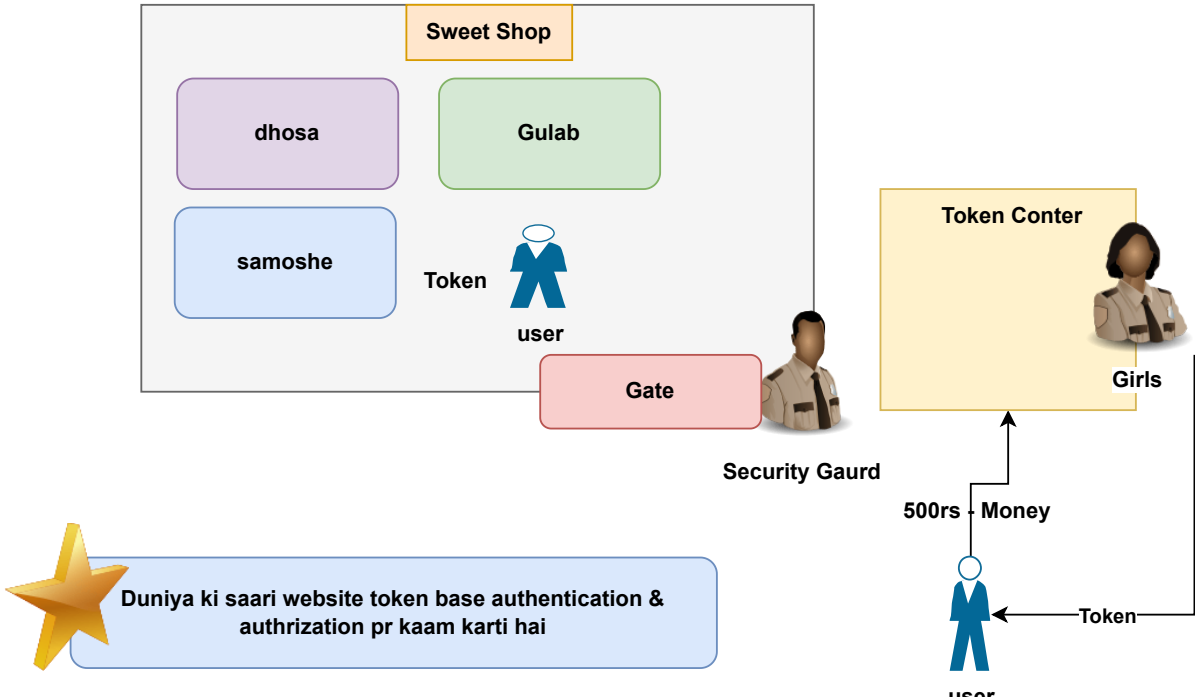

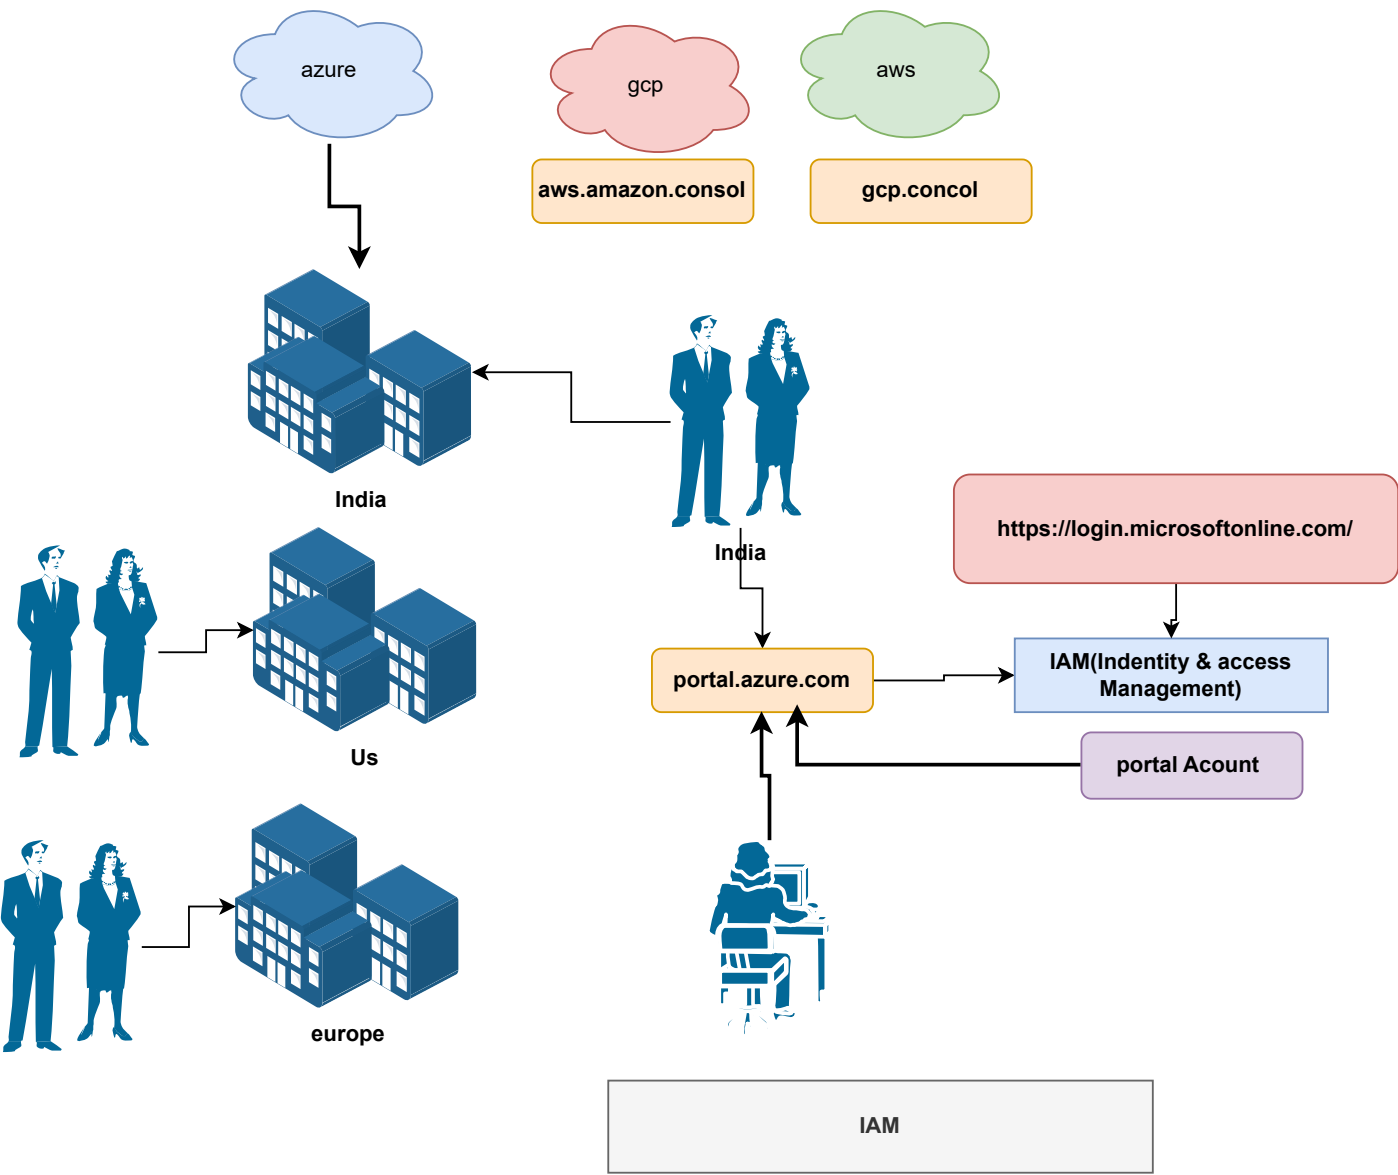

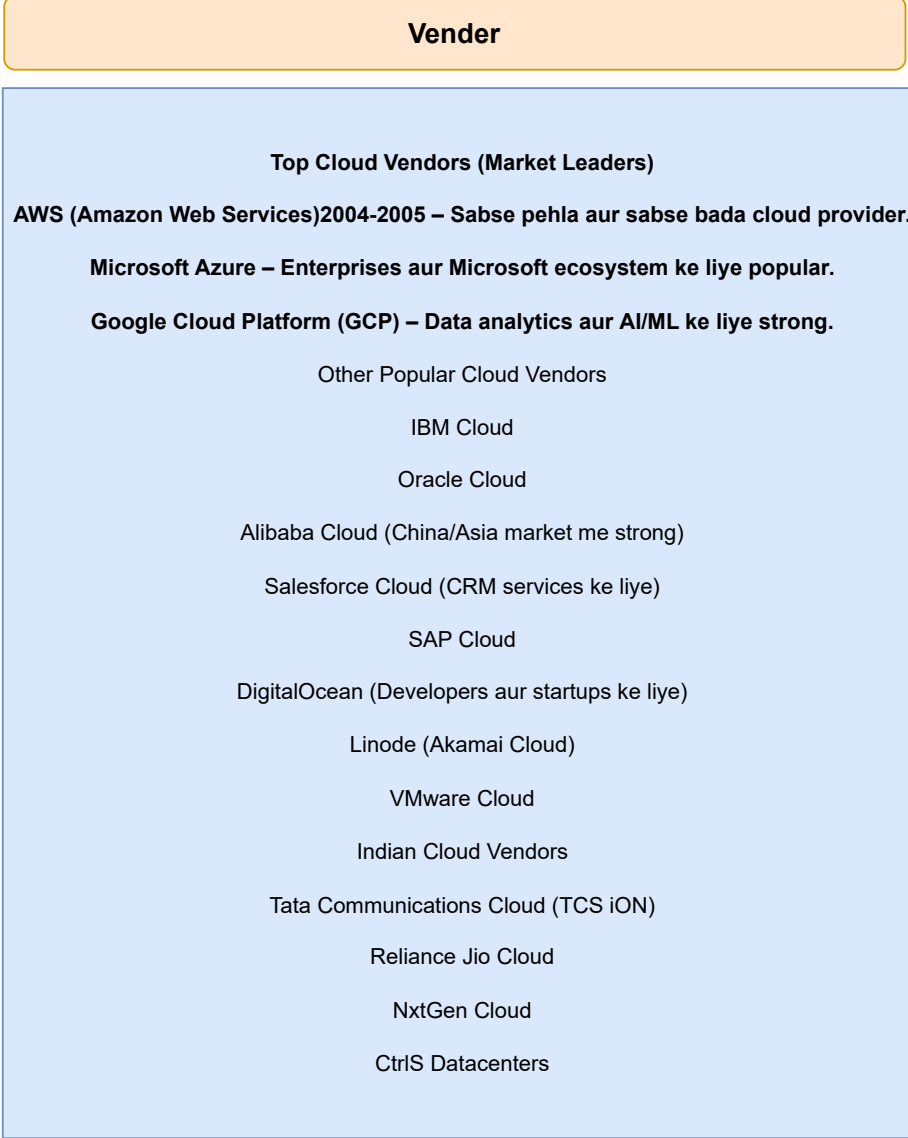

Data Center maintain karna padta tha – Cooling, electricity, physical security sab company ko hi handle karna padta tha.

CapEx (Capital Expenditure) high hota tha – Ek dum shuruaat me hi lakhon-crores ka investment karna padta.

Scalability ka issue – Agar demand achanak badh gayi (jaise festival time me e-commerce), to naye server setup karne me mahine lag jaate.

Maintenance headache – OS update, patching, backup, disaster recovery sab khud manage karna padta tha.

Limited Agility – Naye application deploy karne me bahut time lagta (procurement, installation, testing).

Cloud ki Zarurat Kyon Padi

Pay-as-you-go – Jitna use karo utna paisa do. Shuruaat me heavy investment ki zarurat nahi.

On-Demand Scalability – Demand badhi to minutes me servers add ho jaate, demand kam hui to hata do.

High Availability & DR – Cloud me inbuilt backup, disaster recovery aur multiple datacenters ka option hota hai.

Maintenance kam – Hardware aur infrastructure ka tension cloud provider ka hota hai, company sirf apna app/business pe focus karti hai.

Speed & Agility – Kuch clicks me VM, Storage, Database ready ho jaata hai. Time-to-market bahut fast ho gaya.

Global Reach – Cloud ke datacenters world-wide hai, isliye business easily global customers ko serve kar paata hai.
